

BLUE CHIP™

Kentucky Bluegrass

Blue Chip has been successfully used on some of the top golf courses the world over. You can have confidence Blue Chip will perform for you.

Adding Blue Chip to your blend provides additional resistance to stem rust, leaf rust, summer patch, melting out, necrotic ring spot, leaf spot, pink and snow mold, and dollar spot. It also resists seedling damping off, according to university trials. Blue Chip is nationally ranked in its ability to exclude weeds from the turf by means of competition and not chemicals. It's tops at repelling lawn chinch bug.

Key features

- Improved Sod Strength
- Low Fertility Requirement
- Economical Solution

Close Mowing

Shade Tolerant

| Mowing (Recommendation) | 2-3" |
| Mowing (Down to) | 0.500" |
| *M=1,000 square feet | |

Technical Information

Applications

Blue Chip brings quality performance to your lawn, park, or sports field at an affordable price. Its lush green color and plush growth crowds out weeds but will never overpower your turf with excessive density. Blue Chip adapts to sports field and home lawn mowing heights, with or without irrigation. In test trials it built up less thatch than other varieties and had reduced vertical growth and clippings (lower plant height).

Specifications

Seeding and establishment may be done in spring or fall, but be wary of summer or winter annuals. For better early weed control, consider an application of Mesotrione in the seeding process. Plant seeds to a depth of no more than 0.25-0.50" below the soil surface to ensure good seed to soil contact. Thatch layers will only slow or impede germination success. After spreading seed, keep seedbed moist throughout germination, with extra care during the early stages to prevent seed from drying out after initial seed imbibition. Germination should begin within 10 to 21 days and be complete within 35 days. Remember, the full turfgrass establishment process may take 6 months to a year.
